The Activity Series.

Single-replacement reactions only occur when the element that is doing the replacing is more reactive than the element that is being replaced. Therefore, it is useful to have a list of elements in order of their relative reactivities. The

Access Free
Applying The
activity series is a list of elements in decreasing order of their reactivity. Since metals replace other metals, while nonmetals replace other nonmetals, they each have a separate activity series.

How is the activity series useful in predicting products? It helps predict whether a reaction will occur, and if so what the product will be. It tells you what is more reactive.

In terms of a chemical reaction the activity series predicts $2\text{Ag}^+ + \text{Fe} \rightarrow 2\text{Ag} + \text{Fe}^{2+}$. In contrast, when a Fe^{2+} cation meets a Ag atom, the Fe^{2+} cation will not be strong enough to take electrons away from the Ag atom.
