GDDM (Graphical Data Display

Download File PDF Computer Graphics For The

~~Manager~~) is a computer graphics system for the IBM System/370 which was developed in IBM's Hursley lab, and first released in 1979. GDDM was originally designed to provide programming support for the IBM 3279 colour display terminal and the associated 3287 colour printer. The 3279 was a colour graphics terminal designed to be used in a general business environment.

The IBM Personal Computer (model 5150, commonly known as the IBM PC) is the first computer released in the IBM PC model line and the basis for the IBM PC compatible de facto standard. Released on August 12, 1981, it was created by a team of engineers and designers directed by Don Estridge in Boca Raton, Florida.. The machine was based on open architecture and a substantial market of third ...

This unique work details a set of general graphics routines that C programmers can apply not only to the original IBM color graphics adapter but also to the popular Hercules Graphics Card and compatible monochrome graphics adapters. Focusing on low-level routines, text defines and discusses the elementary routines `initgr`, `move`, `draw`, and `endgr`.

Concrete examples of both hardware and software are used to illustrate the range of graphics capabilities on both vector and raster devices.

Since the introduction of the VGA (Video Graphics Array) in the late 1980s and subsequent extended VGA modes, the IBM PCs could at last display photo-realistic images and movies. Users could now bring graphics into their computers via scanners, digital cameras, even video capture, and have them displayed on their screen or incorporated into their documents.
